

AGENTS.md - V2

Authoritative project specification transport copy

YouTubeTurboStudio — Agent Instructions

Before making architectural or feature changes, read:

``docs/MASTER_ARCHITECTURE.md``

Core Rules

- This is an existing working application. Do not rebuild it from scratch unless explicitly approved.
- Preserve existing working functionality.
- Implement the master architecture incrementally, one requested phase at a time.
- The platform has two video engines:
 1. ``media_video`` for The AI Brief It.
 2. ``animation`` shared by Kids, Elders, and future animated channels.
- Kids and Elders must NOT have duplicated animation-engine implementations.
- Channels must be dynamically configurable; do not hard-code exactly three channels.
- Every generation job must retain its ``channel_id`` through upload.
- Every channel must have isolated credentials and YouTube OAuth.
- Never commit API keys, OAuth tokens, client secrets, refresh tokens, or other credentials.
- Never print full secrets in logs or UI.
- Test videos must remain local/private and must not be automatically uploaded.
- Run focused tests after each phase and fix failures before moving on.
- Do not perform unrelated refactors merely because they are possible.
- Support Shorts and long-form according to channel configuration.
- Kids-specific safeguards are mandatory for Kids and must not automatically apply to Elders.
- The current machine should default to one heavy render pipeline at a time.

Required Completion Report

After implementing a phase, report concisely:

1. Files created/modified.
2. Features implemented.
3. Tests run and results.
4. Dependencies added.
5. Database/schema changes.
6. API keys/environment variables the user must configure.
7. Exact configuration/secret file paths.
8. YouTube OAuth steps if affected.
9. How to run/test the feature.
10. Known limitations/deferred work.

Do not proceed to the next phase unless explicitly asked.

Mandatory content creation modes

The Studio UI must expose exactly three primary generation choices for every channel:

1. `Long Video` - generate a long-form video.
2. `Shorts` - generate an independent standalone Short with no parent link.
3. `Shorts - Link Long Video` - generate purpose-built Shorts linked to a selected long video from the SAME active channel.

`Shorts - Link Long Video` must remain disabled until an eligible long video exists for the active channel. Linked Shorts must persist the parent/content-family relationship and, after the parent is published, automatically include the real parent YouTube URL in the Short description. Never fabricate URLs and never cross-link channels.

Implement this once as shared content-planning/publishing functionality and route rendering to the appropriate channel engine. See Section 38 of `docs/MASTER\_ARCHITECTURE.md` for the authoritative requirements and acceptance criteria.
